When you discover that your computer has a virus on it the situation can instantly become frustrating and overwhelming. The majority of people do not know the first thing to do when it comes to virus removal. Depending on what type of virus you have depends on the extent of damage that may be done. Some viruses display messages while others may download and install other malicious software.

If you dont know the extent of the infection, and you probably dont because its difficult to understand, it is nearly impossible to remove the entire infection. It is for this reason that some security experts consider wiping the computer clean to be the best course of action. Of course, other security experts will disagree.

Your best course of action is to call a computer repairman. They can tell you what is best to do in order to complete virus removal. They will help you back up your information. They will also have a better idea as to the extent of the damage that your virus has caused. They may also be able to help you determine if the virus has caused your personal information, such as passwords or banking information, to be stolen.

Once the damage has been repaired you should also have your computer repairman talk to you about anti-virus protection for the future. This will protect your computer from viruses and therefore you shouldnt have to worry about virus removal in the future.

When you discover that your computer has been overrun with spyware it can be frustrating overwhelming. For many people, their computer contains a lot of their life and it can be scary when the security of having part of your life kept private is suddenly ripped away. Spyware is a type of software that collects information about a person or organization without their knowledge or informed consent and reports the data back to a third party. Spyware can be an annoyance or a serious threat to computer security.

However, just because a computer pop-up tells you that your computer is infected with Spyware it doesnt necessarily mean that you have a problem. Many times a message will actually be from a Spyware creator and will attempt to install more Spyware if you click on it. You should quit the browser and immediately and avoid problems that Spyware creates.

If you find you have Spyware on your computer there are certain downloads that you can access in an attempt to remove Spyware. If you are having difficulty removing Spyware from your computer then you should call a computer specialist in your area. Not only will they be able to help you with Spyware removal but they will be able to recommend anti-virus and anti-spyware software for your future computer protection needs.
